

# The impact of AI on HCI

## How does AI affect the way humans interact with technology?

Currently we are experiencing a new phase for the humankind: the AI. Its not a surprise that AI can maintain a fluid conversation and it's getting every time closer and closer to our daily life, getting better, perfectioning, and becoming more **human**; it even has a good sense of humor! (Cadena SER, 2025).

If you see this under a certain light, it can get terrifier or encouraging. The fact that the AI is becoming more human it means that in some point, it could replace us and is happening already. Look for the chatbots, it seems (at least for a lot of companies) that is the new standard for client assistance, its cheap, fast and very easy to configurate it (Wikipedia).

There is people who use the AI to replicate their deceased relatives, for take therapy or just for ask an advice. It's impressive the uses that we are giving to the AI, now in some cases we can't even identify if a voice is human or not, imagine when we talk about pictures. The companies know this, and the AI is starting to replace the call centers or any human help. (Cadena SER, 2025).

In my opinion, AI can be dangerous if we lost from our view, but I can't deny that it's the future and it's a very helpful tool. I think that we should maintain it like that, a simple tool, that help us to make things, but it doesn't necessary replace us. I prefer to talk with real people and I think the AI can harm the human relations by offering a easiest way to talk with the wall, it's sad that we are preferring this kind of interactions instead of talk with the one beside you.
